- Pressure (P): The force exerted per unit area by a fluid, essential in understanding force transmission within fluid systems.
- Velocity (V): The speed and direction of fluid particles, integral to flow analysis.
- Flow rate (Q): The volume of fluid passing through a cross-section per unit time, typically in m^3/s .
- Reynolds Number (Re): A dimensionless parameter that predicts flow patterns—laminar or turbulent—based on fluid properties and flow conditions.

Governing Principles and Equations

The analysis of fluid systems relies heavily on fundamental equations:

- Continuity Equation: Based on the conservation of mass, it states that for incompressible flows, the mass flow rate remains constant along a streamline:

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2$$

$$A_1 V_1 = A_2 V_2$$

$$\rho_1 A_1 V_1 = \rho_2 A_2 V_2$$

where A is the cross-sectional area, and V is the flow velocity.

- Bernoulli's Equation: Represents the conservation of energy along a streamline, linking pressure, velocity, and elevation:

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

$$P + \frac{1}{2} \rho V^2 + \rho g h = \text{constant}$$

It's fundamental for analyzing ideal flows but requires modifications for real, viscous fluids.
