Key Concepts Covered in Lesson 12.1

- Types of Angles and Their Properties

Understanding the basic types of angles is fundamental. Here are the primary types discussed:

- Complementary Angles: Two angles whose measures add up to 90° .

Example: If angle A measures 40° , then angle B, complementary to A, measures 50° .

- Supplementary Angles: Two angles whose measures add up to 180° .

Example: If angle C measures 110° , then angle D, supplementary to C, measures 70° .

- Vertical Angles: When two lines intersect, the opposite (vertical) angles are equal.

Note: Vertical angles are always congruent.

- Adjacent Angles: Angles that share a common side and a common vertex.

Special Types:

- Linear Pairs: Adjacent angles that are supplementary (sum to 180°).
- Complementary Adjacent Angles: Adjacent angles that are complementary (sum to 90°).

- Angle Pair Relationships

In Lesson 12.1, special attention is given to identifying and proving relationships between angles:

- Vertical angles are equal and often used to find unknown angles when two lines intersect.
- Linear pairs are supplementary, and this property is useful in solving for missing angles.
- Corresponding angles and alternate interior angles are equal when lines are parallel.

- Using Algebra to Find Angle Measures

Students are introduced to algebraic techniques to determine unknown angles:

- Assign variables to unknown angles.
- Use relationships like supplementary or complementary to set up equations.
