Essential Calculations in Himmelblau's Framework

Mass Balance Calculations

The mass balance is fundamental to chemical engineering, ensuring that mass entering and leaving a system is accounted for. The general form of the mass balance equation is:

$$\text{Input} + \text{Generation} - \text{Consumption} - \text{Output} = \text{Accumulation}$$

For steady-state processes where accumulation is zero, the equation simplifies to:

$$\text{Input} + \text{Generation} = \text{Output} + \text{Consumption}$$

Steps to perform a mass balance:

- Define the system boundaries.
- Identify all streams entering and leaving.
- Quantify flow rates, compositions, and phases.

Energy Balance Calculations

Energy balances are crucial for analyzing heat transfer, work interactions, and energy efficiency in processes. The general energy balance is expressed as:

$$\text{In} - \text{Out} + \text{Generated} - \text{Consumed} = \text{Change in stored energy}$$

In steady-state operations, the change in stored energy is zero, simplifying calculations. Key steps include:

- Determine heat and work interactions.
- Account for heat transfer, work done by or on the system.
- Calculate temperature and enthalpy changes.

Understanding reaction rates and designing reactors depend heavily on kinetics principles. The fundamental steps involve:

- Deriving rate expressions based on experimental data.
- Applying mass balances to determine reactant conversions.
- Designing reactor volume and operating conditions to achieve desired conversions.

Common reactor types analyzed include batch, continuous stirred-tank (CSTR), and plug flow reactors (PFR). Calculations involve integrating rate laws over time or reactor length.

Thermodynamics and Phase Equilibrium

Thermodynamic principles guide the understanding of phase behavior, vapor-liquid equilibrium (VLE), and properties of mixtures. Calculations involve:

- Using equations of state (e.g., Peng-Robinson, Soave-Redlich-Kwong).
- Applying Raoult's law and Dalton's law for vapor-liquid systems.
- Determining phase compositions, pressures, and temperatures at equilibrium.

Core Topics in Pharmaceutical Calculations

- Units of Measurement and Conversions

A foundational aspect of pharmaceutical calculations involves understanding and converting between different units.

Common Units in Pharmacy

- Weight: grams (g), milligrams (mg), micrograms (mcg)
- Volume: liters (L), milliliters (mL), microliters (µL)
- Length: meters (m), centimeters (cm), millimeters (mm)
- Time: hours, minutes, seconds

Conversion Factors

- 1 g = 1000 mg
- 1 mg = 1000 mcg
- 1 L = 1000 mL
- 1 mL = 1 cc (cubic centimeter)

Tip: Always double-check unit conversions, especially when switching between weight and volume,

as they are not interchangeable without proper density information.

- Ratios and Proportions

Ratios and proportions form the basis for many calculations, such as dilutions, concentrations, and dosage calculations.

How to Set Up Ratios and Proportions

- Identify known quantities and what you need to find.
- Set up the ratio or proportion accordingly.
- Cross-multiply to solve for the unknown.

Example:

If 10 mL of a solution contains 50 mg of drug, how much drug is in 25 mL?

- Set up ratio: $10 \text{ mL} / 50 \text{ mg} = 25 \text{ mL} / x$
- Cross-multiplied: $10x = 25 \times 50$
- Calculate: $10x = 1250$
- $x = 125 \text{ mg}$

- Dosage Calculations

Proper dosage calculations are critical for patient safety.

Types of Dosage Calculations

- Dose calculations based on weight/body surface area
- Percentage solutions
- Concentrations (e.g., mg/mL)
- Infusion rates

Common Formulae:

- Dose (mg) = Dose prescribed (mg/kg) × Patient weight (kg)
- Volume to administer = Dose (mg) / Concentration (mg/mL)

Practical Calculation Techniques from Sean Parsons

- Working with Concentrations

Understanding how to manipulate concentration data is essential.

- Example: To prepare a solution:
 - Desired concentration: 50 mg/mL
 - Amount needed: 250 mg
 - Volume needed = $250 \text{ mg} / 50 \text{ mg/mL} = 5 \text{ mL}$
- Dilutions

Dilution calculations are common when preparing solutions from concentrated stock.

- Formula: $C_1 V_1 = C_2 V_2$
 - C_1 = initial concentration
 - V_1 = volume of stock solution needed
 - C_2 = desired concentration
 - V_2 = final volume

Example:

Prepare 100 mL of a 10 mg/mL solution from a stock that is 100 mg/mL.

- $V_1 = (C_2 \times V_2) / C_1 = (10 \text{ mg/mL} \times 100 \text{ mL}) / 100 \text{ mg/mL} = 10 \text{ mL}$

- Take 10 mL of stock and dilute to 100 mL total volume.

- Calculating Infusion Rates

Infusion calculations are vital in hospital pharmacy.

- Formula: Infusion rate (mL/hr) = (Dose in mg / Time in hours) / Concentration (mg/mL)

Example:

Administer 500 mg over 4 hours with a solution concentration of 50 mg/mL.

- Infusion rate = (500 mg / 4 hr) / 50 mg/mL = (125 mg/hr) / 50 mg/mL = 2.5 mL/hr
